**Proposal:** 5-31-2837

**Council:** 10/2020

**Title:** Doping induced change of magnetic structure in BaFe<sub>2</sub>Se<sub>3</sub>

**Research area:** Physics

**This proposal is a new proposal**

**Main proposer:** Wengen ZHENG

**Experimental team:** Claire COLIN

**Local contacts:** Claire COLIN

**Samples:** Ba(Fe<sub>1-x</sub>Co<sub>x</sub>)<sub>2</sub>Se<sub>3</sub>

## Abstract:

The Iron-based spin ladder BaFe<sub>2</sub>Se<sub>3</sub> displays an exotic block-like magnetic state. Previous inelastic neutron scattering unveiled the connection between the block magnetic state and an orbital-selective Mott phase (OSMP). Besides, the electron doping of the OSMP could induce new block magnetic states. Thus, the Co/Ni doping of BaFe<sub>2</sub>Se<sub>3</sub> should change the magnetic structure of BaFe<sub>2</sub>Se<sub>3</sub>. We plan to use neutron powder diffraction to investigate this transformation which could help us understanding the origin of the block magnetism and its relation to the OSMP.

## Doping induced change of magnetic structure in BaFe<sub>2</sub>Se<sub>3</sub>

### **- Objective & expected results : -**

The main aim of this proposal was to perform powder neutron diffraction experiments on Ni/Co doped BaFe<sub>2</sub>Se<sub>3</sub>. By Rietveld refinements, the magnetic structure under different doping percentage will be determined. Meanwhile, the transition temperature  $T_N$  will be clarified.

### **- Results and the conclusions of the study (main part): -**

Recently, the Iron-based spin ladder BaFe<sub>2</sub>Se<sub>3</sub> has attracted much attention due to its superconductivity under pressure. Besides, BaFe<sub>2</sub>Se<sub>3</sub> displays an exotic block-like magnetic state which is unique in its family. Previous inelastic neutron scattering unveiled the connection between the block magnetic state and an orbital-selective Mott phase (OSMP). Besides, the electron doping of the OSMP could induce new block magnetic states. Thus, the Co/Ni doping of BaFe<sub>2</sub>Se<sub>3</sub> should change the magnetic structure of BaFe<sub>2</sub>Se<sub>3</sub>.

In this proposal, we used neutron powder diffraction to investigate the possible magnetic transformation from a block-type to other ones. Four samples [Ba(Fe<sub>0.95</sub>Ni<sub>0.05</sub>)<sub>2</sub>Se<sub>3</sub>, Ba(Fe<sub>0.9</sub>Ni<sub>0.1</sub>)<sub>2</sub>Se<sub>3</sub>, Ba(Fe<sub>0.85</sub>Co<sub>0.15</sub>)<sub>2</sub>Se<sub>3</sub>, Ba(Fe<sub>0.8</sub>Co<sub>0.2</sub>)<sub>2</sub>Se<sub>3</sub>] were measured at the temperature range 2-300 K. Figure 1 shows the powder diffraction patterns at 2 K of the four doped samples and the pure BaFe<sub>2</sub>Se<sub>3</sub>. For BaFe<sub>2</sub>Se<sub>3</sub>, a magnetic peak emerges at this temperature (indicated by the star). However, for the doped ones, no obvious magnetic peak was observed. This indicates that the magnetic order is totally suppressed at these high doped samples. Therefore, more neutron diffraction measurements are required on the low doped samples.

Figure1: Powder neutron diffraction patterns of doped samples and pure BaFe<sub>2</sub>Se<sub>3</sub> at 2 K. The star indicates the magnetic peak.
